

TSFS12: Autonomous Vehicles – planning, control, and learning systems

Lecture 1: Erik Frisk <erik.frisk@liu.se>

Outline – todays lecture

- Course description, outline
- This lecture – introduce autonomous systems and autonomous vehicles
 - Autonomous systems, a broader context
 - Enabling technologies
 - **Autonomous vehicles**
- Next lecture we'll start with methods— first topic is discrete planning methods for motion planning

Course personnel

Lecturers

Erik Frisk

Björn Olofsson

Jan Åslund

Course assistants

Pavel Anistratov

Victor Fors

Theodor Westny

Course organization

Course

- Give basic understanding of models, methods, and software libraries to work with autonomous vehicles
 - Focus on planning and control functions ~ a bit down in the software architecture stack, not the highest level functions
 - Implementation important as a means to understand methods
- Autonomous systems and vehicles is too large to cover in a 6 credit course
 - Decision making
 - Perception
 - Planning and control [focus]
 - Sensors
 - Societal, ethical, and legal aspects
 - ...

5

Course

- Course is cross-disciplinary in nature; and we have participants from a wide range of educational background.
 - 7 different engineering programs (Y/D/U/IT/M/I/ED)
 - There are background material that is new to some but not all; You will have to read up
 - You will be expected to explore new areas
- It is a new course, second time — there will be hiccups, timing issues, ...
- We encourage continuous feedback and comments (although we might not always agree with you); we want to know if something is not working

6

Course literature

- Course literature will consist of
 - Articles
 - Chapters from books
 - Lecture notes
 - Links to resources on-line
- This is a developing topic with intensive research and the literature will reflect that. This also means no single course book.
- Download links to material will be available, possibly via LiU library login
- Breadth vs depth:
You will be expected to read advanced texts where you might not be able to understand everything. But don't worry and keep reading.

7

Examination

- No standard written exam.
- To pass with grade 3 you need:
 - Accepted solutions for 5 hand-in assignments.
Typically done in groups of 2.
 - Participate in a mini-project. These are done in groups of 4-5.
- To pass with grade 4 or 5; all requirements for grade 3 *and*
 - Extra tasks for hand-ins (2 and 3 passed for grade 4 and 5 respectively)
- Extra tasks for higher grade are done individually;
handed in no-later than the end of the course.

8

Main examination: Hand-ins

- 5 Hand ins
- Discrete Planning in a Structured Road Network
 - Planning for Vehicles with Differential Motion Constraints
 - Hand-ins are the main examination; they will take time and you are advised to keep in pace. Comparable to regular labs.
 - Solutions in Matlab or Python, up to you (not a course in basic programming, you will need some skill)
 - Groups of 2; with single person groups there will be more reports to grade than our resources allow so please find a partner
 - We can be of assistance pairing groups
 - Vehicle motion control
 - Collaborative control
 - Learning for autonomous vehicles

9

Main examination: Hand-ins

- No close collaborations or code sharing outside groups but of course you can communicate.
- Hand-ins are reported either orally or through a short report.
- **Runnable** code should *always* be submitted via Lisam. Code that does not run is not accepted or evaluated.
- **Deadline for uploading code for hand-ins are Mondays @ 12:00 each week.**
- Possible to ask questions during the exercise sessions when hand-ins are introduced.
- Please do not distribute or make your solutions publicly available, e.g., via a public GitHub repository.

Lecture plan

Week	No	Lecture title
36	1	Introduction
	2	Discrete motion planning
37	3	Modeling of ground vehicles
	4	Planning with differential constraints
38	5	Optimization for motion planning
	6	Control of autonomous vehicles I
39	7	Model Predictive Control for Autonomous Vehicles
	8	Control of autonomous vehicles II
40	9	Collaborative control
41	10	Learning for autonomous vehicles I
41	11	Learning for autonomous vehicles II and guest lecture

11

Schedule overview

	Monday	Tuesday	Wednesday	Thursday	Friday
36		Lecture 1	Lecture 2	Hand-in 1	
37		Lecture 3	Lecture 4	Hand-in 2	Lecture 5 TA session
38	Deadline Hand in 1	Lecture 6	Lecture 7	Hand in 3	TA session
39	Deadline Hand in 2	Lecture 8	Lecture 9	Hand in 4	TA session
40	Deadline Hand in 3		Mini-project, start	Lecture 10	Hand in 5 TA session
41	Deadline Hand in 4			Lecture 11	TA session
42	Deadline Hand in 5			Resource	

12

Mini-projects – 3 main alternatives

- Idea is to make some implementation on a real platform, or a relevant simulation environment to get initial practical experience
- Some emphasis on *mini*, free to explore your own interests
- Group size 4-5
- Examined with an oral presentation + submission of slides and video
- Alt. 1: CrazyFlie — small quad-copters
 - Radio-based positioning system
 - Visionen, camera based positioning system
 - HTC Vive based positioning
- Alt. 2: Remote controlled car(s) with extra equipment
 - Python/C++
 - Robot Operating System (ROS)

Alt. 3: Carla – simulation platform for autonomous vehicles¹⁴

- Open-source simulator for autonomous driving research (www.carla.org)
- Based on the Unreal Gaming Engine
- Python and C++ API
- Can install at home (Linux/Windows)
- Requires decent GPU-card (room Olympen, Nvidia GTX-1080)
- Not photo-realistic, but nice looking

TSFS12 - 2019
SAMPLE PROJECTS

Course material – Lisam, git, and web

17

- Lisam page will be used for messages and handing in your solutions. There is a course WWW-page, static and not used during the course.
- All material will be distributed via course git-repository
<https://gitlab.liu.se/vehsys/tsfs12>
 - Lecture notes
 - Links to reading material
 - Hand-in assignments
 - Updated continuously during the course
- You don't have to know a lot (but do learn) <http://git-scm.com/>
 - % `git clone https://gitlab.liu.se/vehsys/tsfs12`
 - % `git pull # when getting new files`

Corona

18

- Directives change, but as of now the course will be given in distance mode
- All lectures will be pre-recorded,
 - Links on course-git
 - Recorded in segments
- Hand-ins
 - Python/Matlab-based, no need for specialized hardware
 - We will arrange questioning sessions over Zoom
- Final mini-projects
 - Depends a little on development of the pandemic; we will adapt

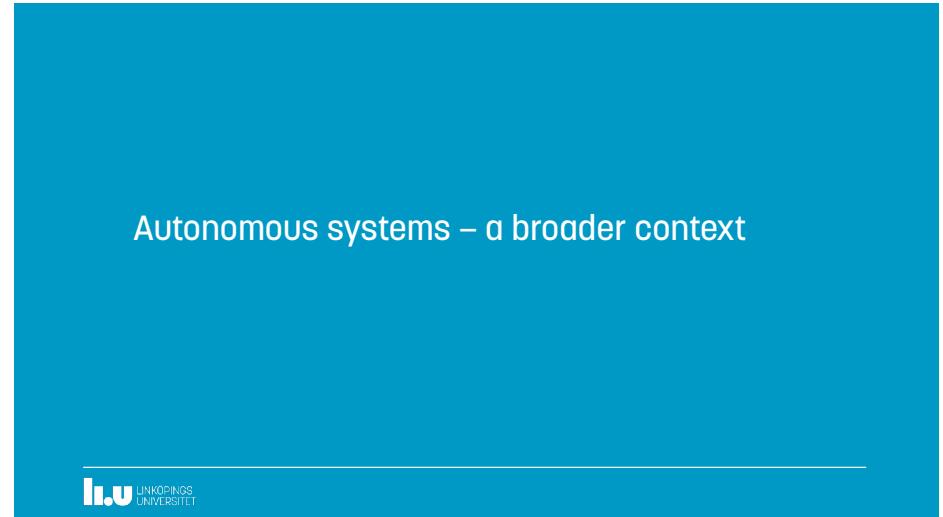

Changes from last years course

19

- No major changes, course went according to plan
- Of course, there are always room for improvement
 - Slightly revised lecture series; extended MPC and learning
 - All hand-ins revised and improved
 - First hand-in; Discrete Planning in a Structured Road Network
 - more advanced option included for students with previous experience in search algorithms
 - Fifth hand-in; Learning for autonomous vehicles
 - Major update
- Corona implications on lectures, exercises, ...

Autonomous systems – a broader context

What is an autonomous system?

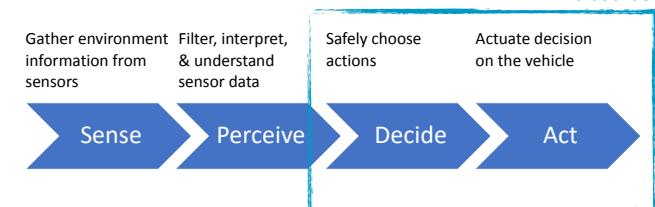

23

An autonomous system is a **cyber-physical** system that is situated in some **environment**, and that is capable of acting **independently** and exhibiting control over its internal state in this environment in order to meet its **delegated objectives**.

Autonomous vehicles

24

This course

Military: OODA-loop (Observe - Orient - Decide - Act)

- Here focus on planning and control of vehicles
- Broad rather than deep course; integration of methods is a main objective

LiU
LINKOPINGS
UNIVERSITET

Definition from F. Heintz, PhD course in autonomous systems

LiU
LINKOPINGS
UNIVERSITET

Why autonomy? Depends on who you ask

25

- In general, reduce cognitive load for decision makers
 - Let short-time decisions be taken autonomously and leave strategic decisions, on a long time-scale, to human operators (if any)
- Driverless cars
 - safety, increased traffic flow, mobility-as-a-service, improved city environment due to less traffic jams, new services ...
- Transport
 - a complete change in business model
 - vehicles are part of a logistic chain
- Work sites
 - Reduce cognitive load on operators; shift from short-term decision making to long-term planning

Example work site

26

Example from Volvo Construction Equipment — Electric Site project

Why autonomy? Depends on who you ask

28

- Autonomous aviation
 - Search and rescue
 - Precision agriculture
 - Distributed healthcare
 - Package delivery
- Marine and Shipping
 - Manage fleets of ships and complete logistic chains, remote supervision
 - Personnel cost and increase cargo capacity
 - Rescue operations

Autonomous vehicles

Sensors and communication – discover environment³³

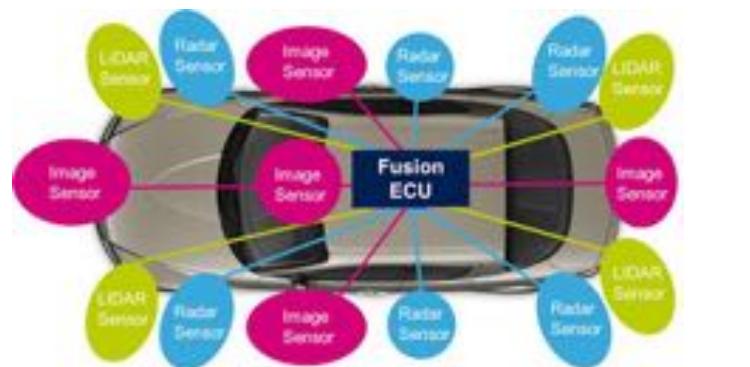

- Cameras
 - Multiple, stereo, infrared, ...
 - passive
- Radar
- Lidar
- Ultrasound
- Microphones
- ...
- Outside the scope of this course, but essential

Sensor placement and selection

Sensors

Challenges

- Cyber security
 - How to ensure automated vehicles are not tampered or influenced from unauthorized agents
- Safety — how, where, and when can we reach human performance or better
- Cost - extra sensors and equipment are expensive (*right now*) (estimates of \$100, 000/level 4 vehicle has been mentioned)
- Robustness — the systems should not only work on summer roads in California, or on a clear summer sky with no wind, with no unexpected events happening.
- Functional safety — how to ensure, and *prove* safety of operation (like aerospace has done for a long time)

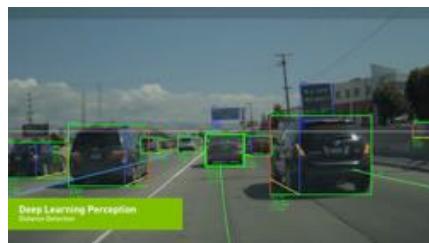

Autonomous vehicles - enabling technologies

Some enabling technologies

- From the start, it became important to know where you are in the world
 - ➡ Localization and mapping
- Then it became important to know more about surroundings
 - ➡ Perception
 - Computer Vision
 - Sensor development, Lidar technology, ...
- A current hot topic is how to model and *predict* behavior of the environment
- AI and Machine learning
- Distributed control, communication, and cloud computing

AI and machine learning

- Current systems are hand-crafted and are heavily based on advanced sensor techniques
- Learning systems have the potential to make high-level autonomy a reality — but we're not there yet
- Probable components where deep-learning systems will be core
 - computer vision
 - model-based reinforcement learning for decision making
- ML will most likely be an important part of the solution (but most likely not *the only* solution)

39

Localization - a fundamental requirement for autonomy⁴⁰

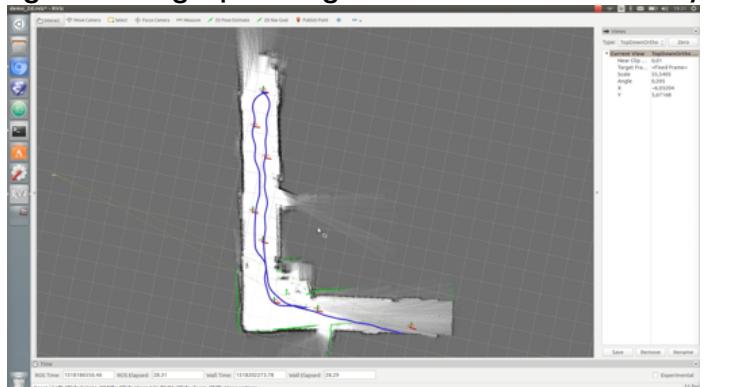

- You need to know your position in the environment
 - GNSS systems — GPS (~ meter), DGPS (~ centimeter)
 - GPS not useful indoors, depend on other sensors
 - Cellular network contains localization information, even more with 5G
- Inertial navigation systems — drift
- Availability of maps depends on application
 - Road network, probably available
 - The insides of a burning building; probably not
- SLAM - Simultaneous Localization And Mapping
 - Simultaneously estimate your position and create a map of the environment

SLAM fundamentals

- Basic idea:
 - Vehicle moves around in an unknown environment m
 - Control the vehicle using steer commands U . Assume you have an uncertain model on how the vehicle moves.
 - Obtain measurements Z from the environment. Assume that the environment doesn't change and associate measurements to *landmarks*, i.e., points of interest (door, wall, ...)
 - Fuse the information to obtain estimate of vehicle position x
- Example measurements: Lidar, IMU, Cameras, WiFi network, cellular network

Googles Cartographer algorithm (Lidar + Odometry)

Slam fundamentals

- Often formulated in probabilistic setting $p(x, m | Z, U)$
- Varying degree of difficulty
 - Static or dynamic environment
 - Landmarks with id or automatic data association
- **Reading material:** Topic for a full course; not covered here. An introduction to the topic, is Chapter 46.1 in Robotics handbook. Link on git-page
- Active area of research, if you are interested I recommend the course TSRT14 — “Sensor Fusion” given here at ISY@LiU

Vision based systems

- Maps are good; but need detailed information about environment that is not included in maps,
 - Detection of other vehicles, pedestrians, cyclists,
 - Road boundaries, road condition, rain, ...
 - Traffic lights, signs, ...
 - Detection of free space
 - Detection of people in a search and rescue mission
- Vision systems and cameras are cost-effective compared to, e.g., Lidar systems
 - Some call Lidars a crutch, some think they are essential

Vision based systems

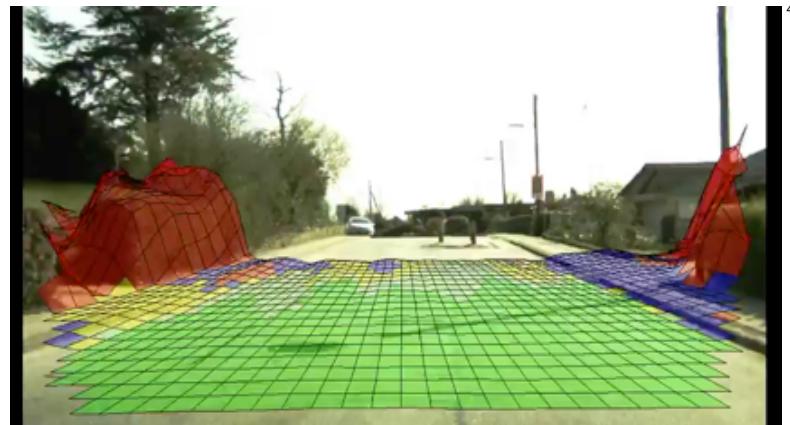

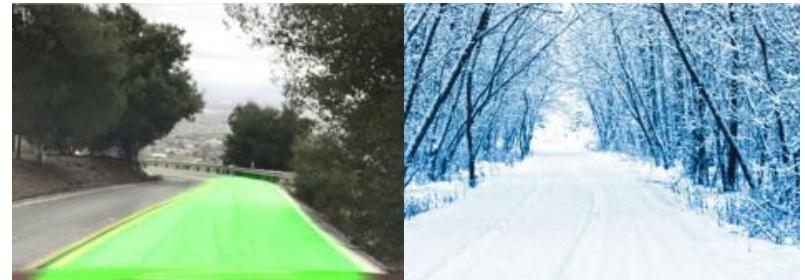

45

- Machine learning methods have enhanced the field tremendously during the last years, but still a long way to go
 - Robustness
 - Reduce need for labeled data
 - Verification of function based on ML models
- Big area for autonomous vehicles that is not covered in this course: recommend courses from computer vision laboratory:

TSBB17 - Visual Object Recognition and Detection

Conditions matter – sun and clean roads, snow, rain, ...

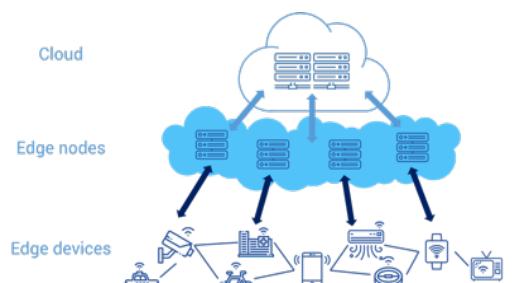

46

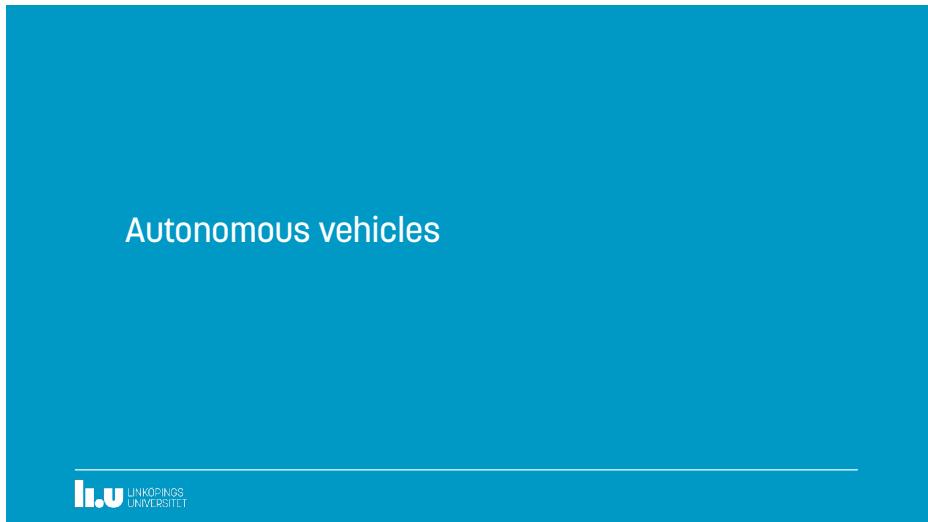

Excerpt from Veoneer video: <https://youtu.be/d6d38b-G2NI>

Distributed control, cloud computing, and communication⁴⁸

- Distributed computations — possibly important to handle the large amounts of computations needed to realize an autonomous system
- Low-latency communication over cellular network — 5G
- Distributed control
- Cloud and edge computing

Autonomous vehicles

Autonomous flight

- Autonomous flight is, in many aspects, easier than autonomous driving
 - Air-space is free-space
 - No (almost) other vehicles
- Autopilot has been around for a long time, the first cross-atlantic automated flight already in 1947
- Control more complex
- Drones; extremely agile and there is extensive knowledge how to control them
- Therefore, in this lecture I will spend a little more time on ground vehicles

Robot-Piloted Plane Makes Safe Crossing of Atlantic

No Hand on Controls From Newfoundland to Oxfordshire—Take-Off, Flight and Landing Are Fully Automatic

By ANTHONY LEVINE

WASHINGTON, Sept. 22.—A Porta airplane said. Two ships were lost in the Atlantic during the last two days, one from Newfoundland to London today after a robot directed her from Newfoundland to Oxfordshire, England. She had 2,500 gallons of fuel aboard.

Porta several weeks ago had acted as a nerve that the Air Force and the Royal Air Force had to take over the digitized Royal Air Force instruments. These, along with other electronic equipment, the Air Force decided to make the transatlantic flight without human control, if possible.

The plane was rolled out at Porta's hangar at 10:30 yesterday morning. The pilot, Captain M. Gilligan of Wilmington, Ohio, started at 11:15 a.m. Flying alone, he and the other passengers climbed aboard. The skywriter was adjusted for the task. On the deck someone pointed a gun at him.

The plane taxied down the field at 11:45 a.m., took off at 12:04, and at 4:50 p.m. the train came back against the wind, and

Continued on Page 2, Column 4

Fig. 2 New York Times, Sept. 23, 1947.

McRuer, Duane, and Dunstan Graham. "Eighty years of flight control—Triumphs and pitfalls of the systems approach." Journal of Guidance and Control 4.4 (1981): 353-362.

Where are we now?

Why is this so difficult in practice?

- Uncertainty, robustness, humans, ...
- Worlds like Go, chess follow simple rules (although succeeding in these games is certainly not simple ...).
 - Closed-world assumption holds true.
- CWA not true for real driving/flying environments; Anything can happen
- Modeling the real world is difficult; significant model errors inevitable
- How do you ensure safety? Humans are fragile and unpredictable.

A main challenge
Introduce robustness, safety, and resilience in autonomous systems

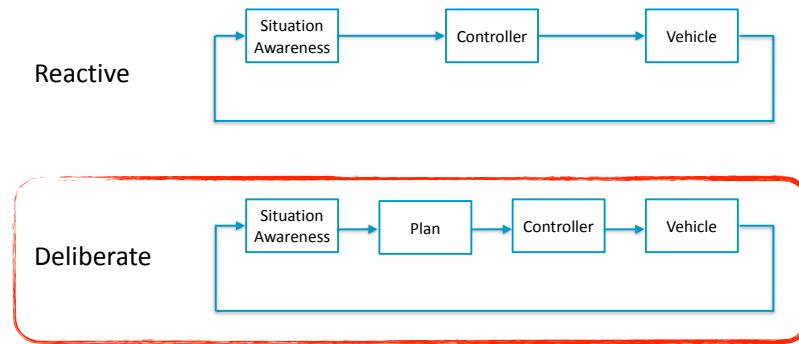

54

The case for autonomy, some arguments

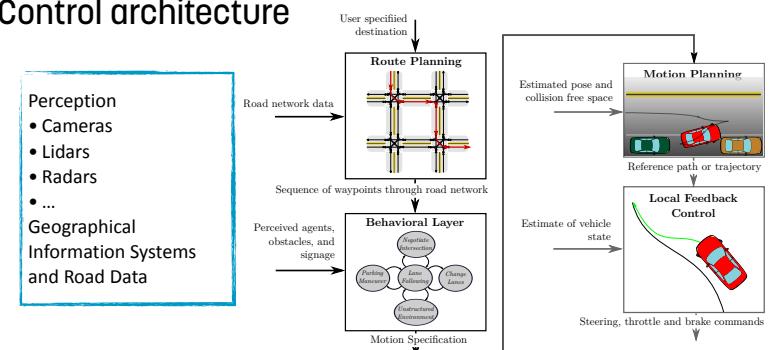

- Passenger cars
 - Safety
 - Increased traffic density
 - New services
- Something not as visible; but with strong commercial potential and a lower hanging fruit than automated taxis in Manhattan
 - Work sites
 - Automated wheel loaders
 - Automated mining vehicles
 - Transportation
 - Dedicated lanes
 - Limited scenarios compared to general driving

Reactive vs deliberate architectures

Control architecture

Control architecture from Paden et al., IEEE Trans. Intell. Vehicles, 1:1, 2016.

What about human drivers?

- There is a lot of research on human driver behavior
- Good to be aware when designing autonomous agents
- Not necessarily imitate

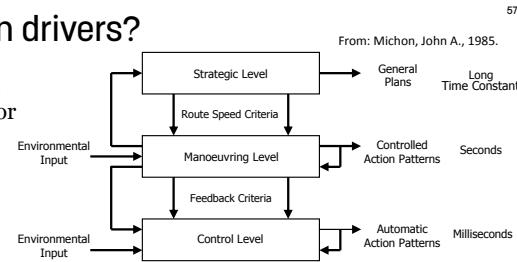

Figure 2 The hierarchical structure of the road user task. Performance is structured at three levels that are comparatively loosely coupled. Internal and external outputs are indicated (after Janssen, 1979).

- **Reading material:** Michon, John A. "A critical view of driver behavior models: what do we know, what should we do?." Human behavior and traffic safety. Springer, Boston, MA, 1985. 485-524. Link on git.

Where are we today?

- Hard to tell; many major car manufacturers have significant investments in the area and also non-automotive actors like Google, Apple, Uber, Nvidia, ...
- Several level 2 functions in production:
Tesla Autopilot, Volvo Pilot Assist, Mercedes-Benz Drive Pilot, Cadillac Super Cruise, ...
- As an outsider, hard to know what is market positioning, PR, and what are solid products in the pipeline?
 - Some manufacturers claim level 3 and even level 4 autonomy in products. A debate for another arena...
 - In this course, focus on fundamental methods
- **Reading material:** "National Highway and Traffic Safety Administration ODI on Tesla" and some critique (opinion piece written by automotive industry analyst). Links on git-page.

Levels of autonomy – (SAE J3016 standard)

SAE level	Name	Narrative definition	Execution of steering and acceleration/deceleration	Monitoring of driving environment	Fallback performance of dynamic driving task	System capability (driving modes)
Human driver monitors the driving environment						
0	No automation	the full-time performance by the human driver of all aspects of the dynamic driving task, even when enhanced by warning or intervention systems	Human driver	Human driver	Human driver	n/a
1	Driver assistance	the driving mode-specific execution by a driver assistance system of either steering or acceleration/deceleration using information about the driving environment and with the expectation that the human driver perform all remaining aspects of the dynamic driving task	Human driver and system	Human driver	Human driver	Some driving modes
2	Partial automation	the driving mode-specific execution by one or more driver assistance systems of both steering and acceleration/deceleration using information about the driving environment and with the expectation that the human driver perform all remaining aspects of the dynamic driving task	System	Human driver	Human driver	Some driving modes
Automated driving system ("system") monitors the driving environment						
3	Conditional automation	the driving mode-specific performance by an automated driving system of all aspects of the dynamic driving task with the expectation that the human driver will respond appropriately to a request to intervene	System	System	Human driver	Some driving modes
4	High automation	the driving mode-specific performance by an automated driving system of all aspects of the dynamic driving task, even if a human driver does not respond appropriately to a request to intervene	System	System	System	Some driving modes
5	Full automation	the full-time performance by an automated driving system of all aspects of the dynamic driving task under all roadway and environmental conditions that can be managed by a human driver	System	System	System	All driving modes

(Figure above from WASP Foresight 2018 - www.wasp-sweden.org)

SAE J3016. Taxonomy and Definitions for Terms Related to Driving Automation Systems for On-Road Motor Vehicles. Tech. rep., SAE International, 2016 (link on course git repository).

Some main challenges for increased automation

- Safety — how to make this technology safe, and gain general trust
 - Recommended reading: U.S. Dept. of Transportation analysis of level 2 system (link on git)
- Cost — autonomy is expensive (100,000 USD extra per vehicle is a cited number)
- Level 3 — mixed responsibility is tricky

SAE level	Name	Narrative definition	Execution of steering and acceleration/deceleration	Monitoring of driving environment	Fallback performance of dynamic driving task	System capability (driving modes)
3	Conditional automation	the driving mode-specific performance by an automated driving system of all aspects of the dynamic driving task with the expectation that the human driver will respond appropriately to a request to intervene	System	System	Human driver	Some driving modes

- Robust and reliable autonomous decision making

Some main challenges for increased automation

- Situation awareness is hard
 - robust and reliable vision and perception systems is an area of intensive development and research
 - Sensor reliability and cost
 - V2x - communication
 - Vehicle-to-vehicle
 - Vehicle-to-infrastructure
- Human in-the-loop
 - With human responsibility (level < 4), how ensure this? Many HMI-issues (see also discussion on this in NHTSA document)
 - Mixed initiative - a sliding scale of autonomy that may change during operation

61

Some main challenges for increased automation

- Verification and certification of machine-learning models
- Power consumption - those GPU cards and sensors do require significant power ~ say corresponding to an AC climate system (1.5 kW)
 - 2% fuel economy on a personal car
 - electric range will be significantly influenced
- Gradual scenario complexity

62

Autonomous cars - a gradual introduction

63

Increasing level of automation

- ABS - Anti-lock Braking System,
- ESC - Electric Stability Control (sometimes referred to as ESP)
- ADAS - Advanced Driver Assistance Systems
 - Lane keeping
 - ACC - Adaptive Cruise Control
 -

Summary

Summary of this lecture and what's next

65

- Autonomous systems — there is a larger context
 - Passenger cars, Transportation, Work sites, Aviation, Marine, ...
 - Possibly large impact on business models and society
- Sliding scale of automation, with human-in-the-loop and HMI; gradual introduction of autonomy and in different applications
- This course; focus on planning and control of vehicles
- Perception, localization, computer vision, sensor fusion, communication, target tracking, ...

www.liu.se

Reading instructions

66

- "Introduction to SLAM". Part E Chapter 46.1 in Siciliano, B., and Oussama K., eds. "Springer handbook of robotics".
- "National Highway and Traffic Safety Administration ODI on Tesla". Interesting text but there are parts that have met critique, see, e.g., NHTSA's Flawed Autopilot Safety Study Unmasked (opinion piece written by automotive industry analyst).
- Interesting discussion on "The Artificial Intelligence podcast" with Sertac Karaman (also author of material for lecture 4) on autonomous driving and flying.
- "A critical view of driver behavior models: what do we know, what should we do?" Michon, John A. Human behavior and traffic safety. Springer, Boston, MA, 1985. 485-524.
- "Effects of driverless vehicles-Comparing simulations to get a broader picture" A. Pernestål et al. European Journal of Transport & Infrastructure Research 19.1 (2019).
